### (Almost) All Hands on Deck for Calcineurin - July 31, 2018

If there was a World Cup soccer championship for cellular proteins, it's a pretty sure bet that calcineurin wouldn't make the team. That's because this protein is one of those players that just can't help but use their hands! And as pretty much everyone knows, that's a big no-no for soccer players (except goalies, of [...])

YeastMine: Getting Started

# youtube.com/SaccharomycesGenomeDatabase

# youtube.com/SaccharomycesGenomeDatabase

# youtube.com/SaccharomycesGenomeDatabase

The screenshot shows the SGD YeastMine website interface. At the top is a YouTube header with the YouTube logo, a search bar, and navigation icons. Below this is the SGD YeastMine logo and a tagline: "Search and retrieve S. cerevisiae data with YeastMine, populated by SGD and powered by InterMine." The date "Data Updated on: Jan-21-2014" is displayed. A navigation menu includes links for Home, Templates, Lists, QueryBuilder, Tools, Regions, Data Sources, API, and MyMine. A search bar on the right contains the text "e.g. act1" and a "GO" button. The main content area is divided into three columns: "Search" (with a magnifying glass icon and instructions to search by name, identifier, or keyword), "Analyse" (with a bar chart icon and instructions to enter a list of identifiers), and "Welcome Back!" (with a video tour link). Below these columns is a horizontal menu with categories: GENOME, PROTEINS, FUNCTION, PHENOTYPES, INTERACTIONS, REGULATION, EXPRESSION, and LITERATURE. A "Query for genome:" section lists various search criteria like "Gene -> Flanking features" and "Gene -> Homologs". A video player overlay is present at the bottom, showing a play button, a progress bar at 0:08 / 1:07, and a volume icon. A text box is overlaid on the video player with the text: "Much like SGD's quick search, you can search for a keyword and retrieve all instances in". The bottom right corner features the SGD logo and the text "Saccharomyces GENOME DATABASE".

# YOX1 / YML027W Regulation

YOX1 encodes a helix-turn-helix transcriptional repressor of the homeodomain family. Yox1p restricts transcription of genes containing early cell cycle boxes (ECBs) to M-G1 phase. Yox1p is an ancillary transcription factor that binds alongside [Mcm1p](#) on promoters. Examples include important cell cycle genes such as [SWI4](#) and [CLN3](#), themselves rate-limiting for cell cycle progression, and essential for the control of subsequent waves of gene expression at G1-S. Yox1p binds upstream of genes involved in spindle function, DNA synthesis and repair, and also associates with a small portion of intergenic regions adjacent to tRNA genes. Removal of Yox1p from promoters allows gene expression at M-G1. YOX1 is under transcriptional regulation by SBF, and [Mcm1p](#) controls the expression of [SWI4](#) which encodes a component of SBF, thereby setting up a negative feedback loop. The transcription of the [CDC20](#) APC (anaphase promoting complex) activator is repressed by Yox1p and kept very low during S phase. Upon mitotic onset, Yox1p abundance declines and the [CDC20](#) gene is actively transcribed. [Cdc28p](#) negatively regulates YOX1 transcription, thereby keeping intracellular levels of Yox1p low, and promoting the transcription of [CDC20](#). Yox1p is an unstable protein, so that suppression of its transcription results in rapid reduction of intracellular protein levels.
